What is Adderall?

Adderall is a prescription stimulant medication that combines amphetamine and dextroamphetamine, two active ingredients known for improving focus and reducing impulsivity. It's commonly prescribed to treat Attention Deficit Hyperactivity Disorder (ADHD) and Narcolepsy, helping individuals maintain alertness and cognitive balance throughout the day.

By influencing neurotransmitters in the brain — specifically dopamine and norepinephrine — Adderall enhances mental clarity, motivation, and sustained attention, making it one of the most effective focus-enhancing medications available.
